

## What is an ODB file?

Posted by isburns - 2007/11/03 22:57

---

These files contain metadata information regarding the watershed, watershed delineation, or AGWA project. The AGWA.odb file contains information regarding the preferences set for a given project (a new AGWA.odb file is created for each project directory). This allows the user to store preferences from one AGWA session to the next. Other ODB files (.odb) contain information regarding watershed attributes. These attributes include discretization parameters, current landcover and soils selections, and simulation details. The file is required for AGWA to recognize the watershed. Attribute values can be viewed in the Metadata viewer (AGWA Tools>View metadata). The watershed ODB files should not be deleted unless the watershed is being deleted. They cannot be rebuilt for an existing watershed.
